

IEEE International Conference on Communications
20-24 May 2019 // Shanghai, China
Empowering Intelligent Communications

CALL FOR PAPERS

SMART GRID COMMUNICATIONS (SAC) SYMPOSIUM

Symposium Co-Chairs

Kemal Akkaya, Florida International University, USA
kakkaya@fiu.edu

Scope and Topics of Interest

Communications technology has profoundly changed our daily lives in the last few decades. From the prosperity of e-commerce to the proliferation of social networking, communications have significantly improved system efficiency, functionality, adaptability and consumer-centricity. We are currently witnessing a similar enablement of power systems to that of a smarter grid providing opportunities for greater sustainability, reliability and increased capacity. As such smart grid systems are on the cusp of a rapid technological, economic and environmental evolution. Communications no doubt is at the center of this surge facilitating situational awareness, real-time management, advanced operation and control and collaboration. For example, wide area monitoring protection and control, advanced metering infrastructure and demand response represent a fraction of the new applications facilitated through greater grid connectivity. Smart grid communication systems must accommodate a wide variety of often changing requirements and constraints. Differences in geographic size, user scale, bandwidth, latency, reliability, interoperability and security have resulted in great debate on appropriate media, tools and technologies. Moreover, the distinct characteristics of power systems make use of off-the-shelf communication systems infeasible at times.

The Smart Grid Communications track invites contributions that explore communication requirements in various grid applications, analyze existing communication technologies within that context and develop communication architectures, protocols, software and communication-centric data-management solutions meeting those requirements. Topics of interest include, but are not limited to:

- Physical layer technologies for smart grid systems
- Medium access and routing protocols for smart grid systems
- Resource allocation and cross-layer optimization for smart grid systems
- Big data management and grid analytics for smart grid systems
- Communication-centric solutions for demand response, demand side management, and energy management
- Coexistence, interoperability and interference in smart grid systems
- Optimized implementation solutions in smart grid systems
- Architectures and networking in smart grid systems
- Data models, communications requirements and quality-of-service for data delivery in smart grid systems
- Modeling, performance analysis, and field trials for smart grid systems
- Effects of communication technologies on smart grid operation and control
- Economic approaches for improving smart grid communications and energy efficiency
- Communication-power system co-design

- Wireless standards and technologies for smart grid applications
- Cyber-physical smart grid system modeling and analysis
- Cyber-physical security and attacks in smart grid systems
- Secure communication architectures for smart grid systems
- Secure patching and firmware updates
- Key management protocols for smart grid systems
- Interaction of electric vehicles and smart grid
- Interoperability and use of legacy systems with the new solutions
- Machine and deep learning approaches for smart grid applications
- Microgrid integration and communications
- Standardization efforts and regulation for smart grid systems

Submission Guidelines

The IEEE ICC 2019 website provides full instructions on how to submit papers and the paper format.

You will select the desired symposium when submitting papers.

The paper submission deadline is October 14, 2018.

Only PDF files will be accepted for the review process and all submissions must be done through EDAS at <http://edas.info/>
